Assignment 2 (2p)

Find the displacement u(x) of a bar of length L using the boundary value problem

$$EA\frac{d^2u}{dx^2} + \rho Ag = 0 \quad x \in]0, L[, \quad u(0) = u(L) = 0$$

given by the continuum model. Assume that the cross-sectional area A, Young's modulus E of the material, density ρ of the material, and acceleration by gravity g are constants.

Solution template

First, repeated integrations with the differential equation are used to find the generic solution. Let the integration constants be a and b:

$$\frac{d^2u}{dx^2} = -\frac{\rho Ag}{EA} \quad \Rightarrow \quad \frac{du}{dx} = \underline{\hspace{1cm}} \Rightarrow \quad u(x) = \underline{\hspace{1cm}}.$$

Second, boundary conditions are used to find the values of the integration constants a and b:

$$u(0) = \underline{\hspace{1cm}} = 0$$
 and $u(L) = \underline{\hspace{1cm}} = 0 \Rightarrow$

$$b =$$
_____ and $a =$ _____.

Finally, the values of the integration constants are substituted into the generic solution to get the solution:

$$u(x) = \underline{\hspace{1cm}}$$
