## Assignment 5 (4p)

The rectangle plate shown, of thickness, length and width t, L, and H, is simply supported on edges where  $x \in \{0, L\}$  and free on the remaining edges where  $y \in \{0, H\}$ , and loaded by pressure p acting on the upper surface. Young's modulus E and Poisson's ratio v are constants. Determine the parameter  $a_0$  of the approximation  $w(x, y) = a_0(x/L)(1-x/L)$ . Use the principle of virtual work in form  $\delta W = 0 \ \forall \delta a_0 \in \mathbb{R}$  and

$$\delta W = -\int_{\Omega} \left\{ \begin{aligned} \frac{\partial^2 \delta w}{\partial x^2} \\ \frac{\partial^2 \delta w}{\partial y^2} \\ 2 \frac{\partial^2 \delta w}{\partial x \partial y} \end{aligned} \right\} D \begin{bmatrix} 1 & v & 0 \\ v & 1 & 0 \\ 0 & 0 & \frac{1}{2}(1-v) \end{bmatrix} \left\{ \begin{aligned} \frac{\partial^2 w}{\partial x^2} \\ \frac{\partial^2 w}{\partial y^2} \\ 2 \frac{\partial^2 w}{\partial x \partial y} \end{aligned} \right\} dA + \int_{\Omega} \delta w b_n dA \,.$$

## **Solution**

Virtual work expression can also be written in the form

$$\delta W = \int_{\Omega} \delta w_{\Omega} dA = \int_{\Omega} (\delta w_{\Omega}^{\text{int}} + \delta w_{\Omega}^{\text{ext}}) dA$$

in which the virtual work densities (virtual work per unit area here) of the internal and external forces

$$\delta w_{\Omega}^{\text{int}} = - \begin{cases} \frac{\partial^2 \delta w}{\partial x^2} \\ \frac{\partial^2 \delta w}{\partial y^2} \\ 2 \frac{\partial^2 \delta w}{\partial x \partial y} \end{cases} D \begin{bmatrix} 1 & v & 0 \\ v & 1 & 0 \\ 0 & 0 & \frac{1}{2}(1-v) \end{bmatrix} \begin{cases} \frac{\partial^2 w}{\partial x^2} \\ \frac{\partial^2 w}{\partial y^2} \\ 2 \frac{\partial^2 w}{\partial x \partial y} \end{cases} \text{ and } \delta w_{\Omega}^{\text{ext}} = b_n \delta w.$$

Approximation to the transverse displacement and its derivatives are

$$w(x, y) = a_0(1 - \frac{x}{L})\frac{x}{L}$$
  $\Rightarrow \frac{\partial w}{\partial x} = \frac{a_0}{L}(1 - 2\frac{x}{L}), \quad \frac{\partial^2 w}{\partial x^2} = -2\frac{a_0}{L^2}, \text{ and } \frac{\partial w}{\partial y} = \frac{\partial^2 w}{\partial y^2} = 0.$ 

When the approximation and distributed force expression  $b_n = p$  are substituted there, virtual work densities of the internal and external forces simplify to

$$\delta w_{\Omega}^{\text{int}} = -\delta a_0 \frac{1}{3} \frac{t^3}{L^4} \frac{E}{1 - v^2} a_0,$$

$$\delta w_{\Omega}^{\text{ext}} = \delta a_0 (1 - \frac{x}{L}) \frac{x}{L} p$$
.

Virtual work expressions are integrals of the densities over the mathematical domain for the plate (midplane)

$$\delta W^{\text{int}} = \int_0^H \int_0^L \delta w_{\Omega}^{\text{int}} dx dy = -\delta a_0 \frac{1}{3} \frac{t^3 H}{L^3} \frac{E}{1 - v^2} a_0,$$

$$\delta W^{\rm ext} = \int_0^H \int_0^L \delta w_{\Omega}^{\rm ext} dx dy = \delta a_0 \frac{1}{6} H L p$$
.

Virtual work expression

$$\delta W = \delta W^{\text{int}} + \delta W^{\text{ext}} = -\delta a_0 (\frac{1}{3} \frac{t^3 H}{L^3} \frac{E}{1 - v^2} a_0 - \frac{1}{6} H L p),$$

principle of virtual work  $\delta W = 0 \ \forall \delta a_0$ , and the fundamental lemma of variation calculus imply the solution

$$\frac{1}{3} \frac{t^3 H}{L^3} \frac{E}{1 - v^2} a_0 - \frac{1}{6} H L p = 0 \qquad \Leftrightarrow \quad a_0 = \frac{1}{2} \left(\frac{L}{t}\right)^3 \frac{L p}{E} (1 - v^2) \; .$$
